SIKA AT WORK
SHOPPING CENTER IN CAMPANIA, ITALY
SUSTAINABLE ROOFING SOLUTION
SIKA ROOFING SOLUTIONS
Sustainable Solutions measured by Life Cycle Assessment (LCA)

PROJECT DESCRIPTION
This project is about the refurbishment of the roof of a shopping center in Italy. The owner was looking for a long lasting and high quality refurbishment solution for a total area of 35'000 m².

PROJECT REQUIREMENTS
The customer was very interested in details regarding durability, performance, and especially on benefits the system could bring in the use phase. The rehabilitation with a competitive generic roofing solution, namely a new 2-layer bituminous waterproofing membrane, was considered as well. Sika convinced the customer with its high performance thermoplastic roofing solution to fulfill their requirements from a technical, economic and environmental point of view.

SIKA'S SUSTAINABLE APPROACH
In warm climates like Italy it is known that white, highly reflective roofing membranes are able to reduce heat absorption and reduce both the cooling energy consumption of buildings and the energy costs.

Thus, Sika proposed an alternative cost-effective solution not only considering the initial construction costs and environmental impacts, but also taking into account the potential savings in terms of Energy and Carbon Footprint that the installation of a high reflective roofing membrane provides.

To differentiate from the black colored generic bituminous solution and to convince the customer of the additional benefits of highly reflective thermoplastic cool roofs, Sika's Global Product Sustainability Group performed a Life Cycle Assessment (LCA) of the two proposed refurbishment solutions with similar performance.

Using light coloured reflective membranes can help reduce energy consumption from avoided heating/cooling. Therefore the estimated potential energy and carbon savings from avoided cooling/heating of the building due to the installation of the white membrane over the black roof are calculated to determine the energy and carbon break-even point of the roofing system, with significant savings.

The estimated potential savings surpass the energy and carbon cradle to gate impacts of Sika’s refurbishment solution within a year.

Besides, it is estimated that with the white membrane almost 119,000 GJ of energy (CED) could be potentially saved compared with the black colour roof in a period of 20 years. This represents potential savings of 600 MWh/year in terms of electricity consumption (and consequently a reduction in the electricity bill).

In terms on GWP, a reduction potential of 6’000 tons CO₂-eq. with the white membrane could be estimated compared with the black roof in a period of 20 years. This means a potential reduction of 300 tons CO₂-eq/year (based on Italian electricity grid mix).

**INVESTING IN SUSTAINABLE SOLUTIONS**

Thanks to LCA it is possible to evaluate the systems’ potential environmental impacts over the entire life cycle and thus select a cost-effective solution not only considering the initial construction costs and environmental impacts, but also taking into account the potential savings in terms of Energy and Carbon Footprint that the installation of a white membrane provides.

The results of the evaluation were decisive for the customer to choose the Sarnafil TS 77-18 RAL 9016 SR, a high solar reflective white membrane, over the bituminous membrane, based on the reduction of the overall environmental impacts, and therefore less costs (economic and environmental) in the long run.

The project allowed Sika to demonstrate its competence and expertise in sustainability, including all relevant quantitative contributions to a sustainable high performance tailor-made roofing solution to fulfil the customer requirements from a technical, economic and environmental point of view.
Life Cycle Assessment (LCA) is a standardized method to assess and compare the inputs, outputs and potential environmental impacts of products and services over their life cycle. LCAs are increasingly recognized as the best way to evaluate the sustainability performance of products and systems. The LCA can greatly assist our customers in evaluating Sika’s products and systems namely by providing quantitative data on their environmental profile. This enables the differentiation of products that may have similar performance, but greater variations concerning their environmental impact – where obviously the lower, the better. Sika carries out LCAs according to the ISO 14040 series and the standard EN 15804. The impact assessment methodology used is CML 2001. The LCA results are presented for the following three relevant impact categories deemed most relevant for roofing systems:

- **Global Warming Potential (GWP) [kg CO₂-eq.] (“Carbon Footprint”)** - is the potential contribution to climate change due to greenhouse gas emissions.
- **Cumulative Energy Demand (CED) [MJ] (“Energy Footprint”)** - is the total amount of primary energy from renewable and non-renewable resources.

**PROJECT PARTICIPANTS**

Owner: ILD Italia di D’Introna Alessandro o & C. S.a.s
Via Aurelio Saffi, 15 25121 Brescia
Contractor: Cover Tech S.r.l.
Zona Industiale - Contrada Alezza - 74012 Crispiano (TA)
