

The owner of this Freightliner truck dealership requested the use of Fibermesh fibers to enhance the quality of this 200,000 square foot parking area. Fibermesh MD was specified at an addition rate of 1.5 pounds per cubic yard for this project. Fiber reinforced concrete was used for all the paving and in the slabs for the metal frame buildings on the site. The contractor was able to increase his production and the owner received more durable and impact-resistant concrete with the use of Fibermesh fiber reinforced concrete.
